So I see my Virus checking software has caught a Phish! So a reminder of whatever operating systems you use keep your updates updated, virus defs updated and have it run scans. Please note at the Sophos page this Phish would attack various OS's.

Louie

"I did go back and look at my taxes and over the past ten years I never paid less than 13%. I think the most recent year is 13.6 or something like that. I paid taxes every single year."

--Mitt Romney

The screenshot shows a Sophos Anti-Virus alert window overlaid on a web browser displaying the Sophos website. The alert window, titled "Threat detected by Sophos", states: "Virus/Spyware: Mal/Phish-A has been detected. Cleanup will be performed automatically." The background website page is titled "Mal/Phish-A" and provides details about the threat, including its category (Viruses and Spyware), type (Malicious behavior), and prevalence. It also lists aliases such as PHISH/CartasiFraud, PHISH/HSBC, Trojan-JS/Cardst, and Trojan-Spy.HTML.Fraud. The page includes recovery instructions and offers to download Sophos products for free. A "Secured" dashboard window is also visible, showing a "Full Scan" button and a "Protection" status of "ON" for Automatic Virus Protection, Web Protection, and Potentially Unwanted App Detection.
